

```
1) Clone the machine
2) run the commands on both machines:

# dhclient -r [ To release the current IP address ]
# dhclient [ To assign new ip address ]
```

```
To check IP
# ip -br -c a
OR
# ifconfig
```

```
Machine A: 192.168.206.140
Machine B: 192.168.206.139
```

```
3) To check connectivity b/w machine A and machine B
```

```
from A to B
.....
```

```
# ping 192.168.206.139 -c 4
```

```
-c : count
```

```
from B to A
.....
```

```
# ping 192.168.206.140 -c 4
```

```
-c : count
```

```
SSH : Secure Shell used to access remote machine on CLI.
```

```
Proto: SSH
Port: 22
Server Side Package: openssh-server
Client Side Package: openssh-client
```

```
Machine A [ Server ]
.....
```

```
1) Install the package:
```

```
# apt install openssh-server -y
```

```
2) Start SSH service:
```

```
# systemctl <action> <service>
```

```
start, stop, restart, reload, status etc...
```

```
# systemctl start ssh
```

```
Machine B [ Client ]
.....
```

```
1) Install Client side package:
```

```
# apt install openssh-client -y
```

```
2) Access server (Machine A) from B
```

```
# ssh username@192.168.206.xxx
```
